EXAMINER

NGUYEN, CHAU T

ART UNIT

PAPER NUMBER

2176

MAIL DATE

DELIVERY MODE

03/03/2009

PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

DETAILED ACTION

1. Applicant's amendment filed on 11/24/2008 has been entered. Claims 1-3, 5-13, 15-16, 18-21, 23-34, 37-38, 41-42 and 45 are pending. Claims 4, 14, 17, 22, 35-36, 39-40, 43-44 and 46-48 are canceled.

Claim Objections

2. The specification is objected to as failing to provide proper antecedent basis for the claimed subject matter. See 37 CFR 1.75(d)(1) and MPEP § 608.01(o). The specification gives no details about the "medium" or "media". The description of the must provide clear support or antecedent basis for the terms and phrases used in the claims so that the meaning of the terms and phrases may be ascertained, as required in Rule 75. Appropriate correction is required.

Claim Rejections - 35 USC § 101

3. 35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

4. Claims 1-3, 5-11, 28-29, 34 and 37 are rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter.

Claims 1-3, 5-11, 28-29, 34 and 37 recite an "editing apparatus". The specification does not specifically describe the word "apparatus," but it talks about "editing device" and "editing system". One of ordinary skill in the art would have considered "editing device" and/or "editing system" as the recited "editing apparatus".

The specification expressly states (see Page 16, Lines 31-33) that the "selective editing systems . . . illustrated herein however, can be readily **implemented in**

Art Unit: 2176

hardware and/or software" (emphasis added). Additionally, the examiner notes that none of Claims 1-3, 5-11, 28-29, 34 and 37 expressly recite a computer hardware component. Thus, the "editing device" (i.e., the "editing apparatus" of Claim 1) may be properly interpreted as computer software per se.

Accordingly, the invention recited in Claims 1-3, 5-11, 28-29, 34 and 37 is not a "process," a "machine," a "manufacture" or a "composition of matter," as defined in 35 U.S.C. 101.

Claim Rejections - 35 USC § 112

5. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

6. Claims 1, 12 and 20 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claims 1, 12 and 20 contain newly added amendment **"a content item editing merging device adapted to perform a check in an actively live web page to whether a content item modified by an author is comparable to the template information edited by a user during the content item modification, merges one or more parts of the modified content item in comparison with the edited template information based on the check performed, and merges the compared content item with the edited template information back into the electronic document"**, which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that

Art Unit: 2176

the inventor(s), at the time the application was filed, had possession of the claimed invention.

In the Remarks filed on 11/24/2008, the applicant has pointed out that the paragraph [0011] of the published application would support the newly added amendment. The examiner disagrees. The paragraph [0011] recites "The exemplary systems and methods of this invention provide tools for group editing of electronic documents. In particular, the tools allow for group editing of web pages. By parsing a web page and locating elements, such as items, templates, and formatting code, such as HTML, within a web page, a user is presented with a user interface that allows for editing of those elements. Furthermore, by performing a check, upon completion of editing of one or more elements within a web page, the updated web page is merged with the "live" version of the web page to incorporate any changes that may have also been made by other users. In this manner, the web page remains live, and changes made to the live group- editable page are not lost." This paragraph includes "performing a check, upon completion of editing of one or more elements within a web page, the updated web page is merged with the "live" version of the web page to incorporate any changes that may have also been made by other users", NOT "perform a check to whether a content item modified by an author is comparable to the template information edited by a user during the content item modification".

Applicant also pointed out that the paragraph [0040] of the published application would support the newly added amendment. The examiner disagrees. Paragraph [0040] recites "The template edit device 160 then compares the new template with the

Art Unit: 2176

original template. If field tags have been removed from the edited template, a determination is made whether the data fields associated with the deleted field(s) should be discarded. If the data fields are to be discarded, the template edit device deletes the data fields." One of ordinary skill in the art would not be able to interpret this paragraph as **"a content item editing merging device adapted to perform a check in an actively live web page to whether a content item modified by an author is comparable to the template information edited by a user during the content item modification, merges one or more parts of the modified content item in comparison with the edited template information based on the check performed"**.

Applicant further pointed out that the paragraph [0054] of the published application would support the newly added amendment. The examiner disagrees. Paragraph [0040] recites "it is possible for the page author to modify an item template at the same time that the contributor is adding or editing items to a page", which does not support the amended claim. Appropriate corrections are required.

7. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

8. Claims 1, 12 and 20 are rejected under 35 U.S.C. 112, second paragraph, as being incomplete for omitting essential steps, such omission amounting to a gap between the steps. See MPEP § 2172.01. The omitted steps are: after comparing a content item modified by an author and the template information edited by a user, what

Art Unit: 2176

will happen if the content item modified by an author is similar and/or different from the template information edited by the user. Appropriate corrections are required.

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1-3, 5-13, 15-16, 18-21, 23-34, 37-38, 41-42 and 45 are rejected under 35 U.S.C. 103(a) being unpatentable over Bay-Wei Chang, "In-Place Editing of Web Pages: Sparrow Community-Shared Documents", published 04/1998 (hereinafter Chang), in view of Giljum et al. US006745238B1- filed 03/31/2000 (hereinafter Giljum '238), and further in view of Zhu et al, US Patent No. 6,654,032 (hereinafter Zhu).

In regard to independent claim 1, A group-editable web page editing apparatus comprising:

an element selection device adapted to select a portion of an electronic document, wherein the selected portion includes at least one of template information (the Chang reference describes the claimed group-editable web page editing system, in the form of in-place editing of Sparrow community-shared web page documents (Chang's Title, page 1). The Chang reference further describes the claimed an element selection device that selects a portion of an electronic document, wherein

Art Unit: 2176

the selected portion includes information stored within the electronic document, in the form of clicking on a black triangle (page 3, lines 2-3 and Figure 2), and the information selected in Chang is content information.

formatting information stored within the electronic document; an editing device adapted to determine an edit user interface and allows editing of the selected portion through the edit user interface, wherein the edit user interface allows editing of at least one of the template information or the formation information of the selected portion (The Chang reference describes the electronic document is an HTML document with template, formatting, and content information (page 5, lines 16-19, page 11, line 5, pages 11-12, section 4.1, and pages 13-14, section 4.5. The Chang reference also describes the formatting information comprises codes which are distinct from editable content items. Page 14 shows standard “” and “” HTML bold formatting information stored within the electronic document and distinct content information “Abe L.” stored within the document. The Chang reference further describes that the formatting information is editable by an authorized user (page 11, line 2);

and an updating device adapted to replace the selected portion with the edited portion (The Chang reference describes the claimed an updating device that replaces the selected portion with the edited portion, in the form of supplanting the original (page 4, lines 3-5).

Chang teaches the desirability of editing template or format information (page 11, line 2). To support the teaching of Chang, Giljum teaches that it is desirable to edit the

Art Unit: 2176

template or “style” and edit the formatting or “fonts” of web pages (col. 8, lines 3-5 and col. 8, lines 52-54).

Thus both Chang and Giljum provide a sufficient suggestion to a person of ordinary skill in the art at the time the invention was made to modify Chang’s system to include group editing of template or formatting information in addition to Chang’s group editing of content information.

a content item edit merging device adapted to perform a check in an actively live web page as to whether a content item modified by an author is comparable to the template information edited by a user during the content item modification, merges one or more parts of the modified content item in comparison with the edited template information based on the check performed, and merges the compared content item with the edited template information back into the electronic document (The Chang reference teaches that the contributor (user) makes changes to the item (element), and when he is done making changes to the item, and clicks the “OK” button, Sparrow makes the change to the web page and redirects the user’s browser back to the original URL, which now shows the newly altered page (page 5, lines 1-4). The Chang reference further discloses checking if the sequence numbers of the edited version (by user) of the item and of the version of the item stored in the files system (by an author) differ, then an edit to the item has occurred while the user was himself editing the item (page 14, section 4.6). The Chang reference further discloses Sparrow providing editing of specific parts of web pages (by contributor or user), not entire web page, and the web page author creates the entire page, and

Art Unit: 2176

adds Sparrow capability to the parts he or she wishes to have people contribute to, and the items in the Sparrow-enabled parts can be edited and added to, forming growing lists of items (page 5, third paragraph). The Chang reference further describes an edit merging device that merges first modified content information back to into the electronic document even if second content information was altered while the first information was modified (page 7, lines 16-19, page 14, section 4.6). Thus these imply the updated web page is merged with the “live” version of the web page.

To support the implication of Chang, Zhu teaches a conferencing server distributes the shared screen (electronic document) to a plurality of remote clients, each of the remote clients having a viewer application to display the share screen, and the shared screen being simultaneously displayed during the live data conference (col. 11, lines 11-18). Zhu further describes receiving user input form one of the remote clients and drive the application to edit the application screen based on the user input to produce an application screen update which is used to create a shared screen update (col. 11, lines 19-29). Zhu further describes sending the shared screen update to the conferencing sever, and the conferencing server distributes the shared screen update to the remote clients, and the shared screen update being simultaneously displayed during the live data conference (col. 11, lines 30-38).

Thus both Chang and Zhu provide a sufficient suggestion to a person of ordinary skill in the art at the time the invention was made to modify Chang’s system to include merging the update information edited from the user input to create shared screen

Art Unit: 2176

update being simultaneously displayed during the live data conference in addition to Chang's merging the modify content information back into the electronic document.

a template edit merging device that merges a modified item template back into the electronic document even if the user edits the content of one or more items managed by the item template in the actively live web page, while the item template is simultaneously being modified or updated by the author (The fact shows that Chang teaches merging first modified content information back into the electronic document even if second content information was altered while the first information was modified (page 7, lines 16-19; and page 14, section 4.6). That is, "pages are not locked during [group] editing" and edits must be resolved by the user only if "an edit to the [same] item has occurred." (Chang, page 14). Thus, the Chang reference provides a sufficient suggestion to those skilled in the art to modify the Chang system to permit merging of modified first information back into the electronic document even if second information was altered while the first information was modified, so long as the first and second information are not the same information.

In regard to independent claims 12 and 20, incorporate substantially similar subject matter as cited in claim 1 above, and is similarly rejected along the same rationale. Examiner read the above in the broadest reasonable interpretation to the claim limitation, wherein a user interface would have been an obvious variant of users' computers and user manipulation of a graphical user interface, to a person of ordinary skill in the art at the time the invention was made.

In regard to dependent claims 2-3, incorporate substantially similar subject matter as cited in claim 1 above, and further view of the following, and are similarly rejected along the same rationale; **accounts for one or more edits by other users and are stored in a queue** (as taught by Chang, page 1, Introduction Section, discloses the Web pages are jointly edited by more than one person, much meta-information about the page must be distributed in addition to its URL: who is currently editing the page, where the page is stored in the files system, who has permission to write to that file system, and so on).

In regard to independent claim 5, incorporate substantially similar subject matter as cited in claim 1 above, and is similarly rejected along the same rationale.

In regard to dependent claim 6, incorporate substantially similar subject matter as cited in claim 1 above, and further view of the following, and is similarly rejected along the same rationale;

represents at least one non-selected portion of the electronic document with a place holder (Chang at page 7, section 2.2, discloses a lightweight editing technology for the Web, wherein one item at a time being edited using "Editing in-place", and during editing, the context of the rest of the page remains in place. The metaphor used is that of the outliner: the triangle graphic turns downwards to open up a region holding more detail, in this case, an editing region. Meanwhile, the page content above and below the editing region remains unchanged and visible. The user is free to browse the rest of the page even when editing, Chang at page 1, Introduction section, prescribing the types of editing allowed, and presenting forms for user interaction. In

Art Unit: 2176

addition the interface attempts to leverage existing conventions in order to allow first-time users to feel comfortable initiating an edit without prior instruction) Examiner read the above in the broadest reasonable interpretation to the claim limitation, wherein place holder would have been an obvious variant of the editing region remains unchanged and visible and presenting forms for user interaction, to a person of ordinary skill in the art at the time the invention was made.

In regard to dependent claim 7, incorporate substantially similar subject matter as cited in claims 1 and 6 above, and is similarly rejected along the same rationale.

13, and is similarly rejected under the same rationale.

In regard to dependent claim 8, the element selection device permits selection of all portions of the electronic document that are associated with a given portion class (Chang at page 10, section 3.3, Interview schedule, discloses the interview schedule which is an example of a class of Sparrow pages...), and also at page 13, section 4.4 Fields, Python subclass.

In regard to dependent claim 9, the portion classes include the class of items, the class of templates, and the class of remaining code (Chang, at page 11, section 4.1 paragraph 1, Sparrow provides flexible authoring for creating many different kinds of content. Sparrow items are specified declaratively, by creating a template that includes the fields that will be used and the HTML formatting around the field entries...).

In regard to dependent claim 10, a user may select and edit portions of the template class, while one or more other users may simultaneously edit portions of the item class (Chang, at page 14, section 4.6, paragraph 1, discloses a method,

Art Unit: 2176

wherein one user may change an item on a page without affecting other users who are editing other items on the same page...).

In regard to dependent claim 11, one user may select and edit portions of the remaining code class (Chang, at page 15, section 5 paragraphs 5, discloses Web Edit [6], Web Writer [2, 3], and Wiki Web all implement browser-based editing of Web pages. Like Sparrow, these systems allow one to edit pages directly within the browser, thus freeing the user from starting another tool or knowing where the page is stored on the filesystem. Unlike Sparrow, they require knowledge of HTML and editing occurs over the entire contents of a page...).

In regard to dependent claims 13 and 21, incorporate substantially similar subject matter as cited in claim 2 above, and are similarly rejected along the same rationale.

In regard to dependent claims 15, 16, 18, 23, 24, 26 and 32 incorporate substantially similar subject matter as cited in claim 6 above, and are similarly rejected along the same rationale.

In regard to dependent claim 19, incorporate substantially similar subject matter as cited in claim 9 above, and is similarly rejected along the same rationale.

In regard to dependent claim 25, incorporate substantially similar subject matter as cited in claims 1 and 3 above, and further view of the following and is similarly rejected along the same rationale;

instruction that unlocks the electronic document... however (Giljum '238 at col. 12, line 30 through col. 13, line 50, also see Fig. 10 through Fig. 13, provides a mechanism to grant folder privileges to groups, wherein the Web Site Database includes an interface for adding new items (e.g., the files, text and URLs) to the Web Site. In addition, this interface permits the user, with the proper privileges user s are providing "check out item" (e.g. no other contributor may edit the item) tool applies only to items enabled for check out and a "checked-in item" tool permits a contributor to return the updated item to the folder after editing it) Examiner read the above in the broadest reasonable interpretation to the claim limitation, wherein instruction that unlocks the electronic document would have been an obvious variant of a "checked-in item" tool permits a contributor to return the updated item to the folder after editing it (e.g.. Web Site), to a person of ordinary skill in the art at the time the invention was made.

It would have been obvious to a person of ordinary skill in the art at the time the invention was made to have modified Chang's teaching, discloses a group-editable web page editing system comprising: formatting information stored within the electronic document, and an updating device that replaces the selected portion with the edited portion, to includes a means of instruction that unlocks the electronic document of Giljum '238. One of the ordinary skill in the art would have been motivated to modify this combination to enable the content contributor (e.g. to create a web site, the person, referred to as the content contributor, submits the content (e.g., files and images) to the web site administrator for publication) may not be technical and may not have any

Art Unit: 2176

knowledge of HTML, and eliminating a bottleneck the web site administrator prior to publishing the content, and ensuring that the content is up to date and accurate (as taught by Giljum '238 at col. 1, lines 30-55).

In regard to dependent claim 27, incorporate substantially similar subject matter as cited in claim 9 above, and is similarly rejected along the same rationale.

In regard to dependent claims 28 and 30, incorporate substantially similar subject matter as cited in claims 1 and 12 above, and are similarly rejected along the same rationale.

In regard to dependent claim 29, incorporate substantially similar subject matter as cited in claims 1 and 12 above, and is similarly rejected along the same rationale. Examiner read the above in the broadest reasonable interpretation to the claim limitation, wherein is web page would have been an obvious variant of an electronic document, to a person of ordinary skill in the art at the time the invention was made.

In regard to dependent claims 31 and 33, incorporate substantially similar subject matter as cited in claims 1, 12 and 29 above, and are similarly rejected along the same rationale.

In regard to dependent claims 34, 38 and 42, Chang discloses wherein the formatting information comprises at least one of text, images, and formatting codes editable by one or more authorized users, and wherein the formatting information is distinct from editable content items of the electronic document (page 5, lines 16-19,

Art Unit: 2176

page 11, line 5, pages 11-12, section 4.1, and pages 13-14, section 4.5: Chang describes the electronic document is an HTML document with template, formatting and content information, the formatting information comprises codes which are distinct from editable content item. Page 14 shows standard "" and "" HTML bold formatting information stored within the electronic document and distinct content information "Abe L." stored within the document. Chang further describes that the formatting information is editable by an authorized user (page 11, line 2).

In regard to dependent claims 37, 41 and 45 incorporate substantially similar subject matter as cited in claims 1, 6 and 12 above, and are similarly rejected along the same rationale.

Response to Arguments

In the remarks, Applicant argued in substance that

A) The examiner has made the objection to the specification for failing to provide proper antecedent basis for the claimed subject matter, in which the specification gives no details about the "medium" or "media". Applicant argued "paragraph [0080] of the published application in which there is described a hardware peripheral integrated circuit element (i.e., computer readable medium) for implementing the selective editing device/apparatus." (see page 9 of remarks)

Art Unit: 2176

In response to argument A, the examiner disagrees. One of ordinary skill in the art would **NOT** have interpreted “peripheral integrated circuit element” as “computer readable medium” because nowhere in paragraph [0080] of the Specification describes such a thing. Therefore, the examiner's still maintained the objection.

B) The Office action has failed to establish a prima facie case of obviousness.

In reply to argument B, to establish a prima facie case of obviousness, three basic criteria must be met.

First, there must be some suggestion or motivation, either in the references themselves or in the knowledge generally available to one of ordinary skill in the art, to modify the reference or to combine reference teachings. In this case, the Chang reference describes that the formatting information is editable by an authorized user (page 11, section 1.2). The Giljum patent teaches that it is desirable to edit the template or "style" of web page (col. 8, lines 3-5) and edit the formatting or “fonts” of web page (col. 8, lines 52-54). The Zhu reference teaches a conferencing server distributes the shared screen (electronic document) to a plurality of remote clients, each of the remote clients having a viewer application to display the share screen, and the shared screen being simultaneously displayed during the live data conference (col. 11, lines 11-18). Zhu further describes receiving user input form one of the remote clients and drive the application to edit the application screen based on the user input to produce an application screen update which is used to create a shared screen update (col. 11, lines 19-29). Zhu further describes sending the shared screen update to the

Art Unit: 2176

conferencing sever, and the conferencing server distributes the shared screen update to the remote clients, and the shared screen update being simultaneously displayed during the live data conference (col. 11, lines 30-38). Thus, the references provide a sufficient suggestion to those skilled in the art to modify the Chang system to include group editing of template or formatting information in addition to Chang's group editing of content information.

Second, there must be a reasonable expectation of success. The prior art can be modified or combined to reject claims as prima facie obvious as long as there is a reasonable expectation of success. In re Merck & Co., Inc., 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986). In this case, claimed invention directed to a group-editable web page editing apparatus was rejected as obvious over reference Chang, which teaches the formatting information is editable by an authorized user (page 11, section 1.2), in view of reference Giljum, which teaches editing the template or "style" of web page (col. 8, lines 3-5) and edit the formatting or "fonts" of web page (col. 8, lines 52-54), and further in view of Zhu, which teaches receiving user input from one of the remote clients and drive the application to edit the application screen based on the user input to produce an application screen update which is used to create a shared screen update (col. 11, lines 19-29). Thus, there was reasonable expectation that a process combining the prior art steps could be successfully scaled up.

Finally, the prior art reference (or references when combined) must teach or suggest all the claim limitations. Chang discloses a group-editable web page editing apparatus comprising:

an element selection device adapted to select a portion of an electronic document, wherein the selected portion includes at least one of template information (the Chang reference describes the claimed group-editable web page editing system, in the form of in-place editing of Sparrow community-shared web page documents (Chang's Title, page 1). The Chang reference further describes the claimed an element selection device that selects a portion of an electronic document, wherein the selected portion includes information stored within the electronic document, in the form of clicking on a black triangle (page 3, lines 2-3 and Figure 2), and the information selected in Chang is content information.

formatting information stored within the electronic document; an editing device adapted to determine an edit user interface and allows editing of the selected portion through the edit user interface, wherein the edit user interface allows editing of at least one of the template information or the formation information of the selected portion (The Chang reference describes the electronic document is an HTML document with template, formatting, and content information (page 5, lines 16-19, page 11, line 5, pages 11-12, section 4.1, and pages 13-14, section 4.5. The Chang reference also describes the formatting information comprises codes which are distinct from editable content items. Page 14 shows standard "" and "" HTML bold formatting information stored within the electronic document and distinct content information "Abe L." stored within the document. The Chang reference further describes that the formatting information is editable by an authorized user (page 11, line 2);

and an updating device adapted to replace the selected portion with the edited portion (The Chang reference describes the claimed an updating device that replaces the selected portion with the edited portion, in the form of supplanting the original (page 4, lines 3-5).

Chang teaches the desirability of editing template or format information (page 11, line 2). To support the teaching of Chang, Giljum teaches that it is desirable to edit the template or “style” and edit the formatting or “fonts” of web pages (col. 8, lines 3-5 and col. 8, lines 52-54).

Thus both Chang and Giljum provide a sufficient suggestion to a person of ordinary skill in the art at the time the invention was made to modify Chang’s system to include group editing of template or formatting information in addition to Chang’s group editing of content information.

a content item edit merging device adapted to perform a check in an actively live web page as to whether a content item modified by an author is comparable to the template information edited by a user during the content item modification, merges one or more parts of the modified content item in comparison with the edited template information based on the check performed, and merges the compared content item with the edited template information back into the electronic document (The Chang reference teaches that the contributor (user) makes changes to the item (element), and when he is done making changes to the item, and clicks the “OK” button, Sparrow makes the change to the web page and redirects the user’s browser back to the original URL, which now shows the newly altered page (page 5, lines 1-4). The Chang reference

Art Unit: 2176

further discloses checking if the sequence numbers of the edited version (by user) of the item and of the version of the item stored in the files system (by an author) differ, then an edit to the item has occurred while the user was himself editing the item (page 14, section 4.6). The Chang reference further discloses Sparrow providing editing of specific parts of web pages (by contributor or user), not entire web page, and the web page author creates the entire page, and adds Sparrow capability to the parts he or she wishes to have people contribute to, and the items in the Sparrow-enabled parts can be edited and added to, forming growing lists of items (page 5, third paragraph). The Chang reference further describes an edit merging device that merges first modified content information back to into the electronic document even if second content information was altered while the first information was modified (page 7, lines 16-19, page 14, section 4.6). Thus these imply the updated web page is merged with the “live” version of the web page.

To support the implication of Chang, Zhu teaches a conferencing server distributes the shared screen (electronic document) to a plurality of remote clients, each of the remote clients having a viewer application to display the share screen, and the shared screen being simultaneously displayed during the live data conference (col. 11, lines 11-18). Zhu further describes receiving user input form one of the remote clients and drive the application to edit the application screen based on the user input to produce an application screen update which is used to create a shared screen update (col. 11, lines 19-29). Zhu further describes sending the shared screen update to the conferencing sever, and the conferencing server distributes the shared screen update to

Art Unit: 2176

the remote clients, and the shared screen update being simultaneously displayed during the live data conference (col. 11, lines 30-38).

Thus both Chang and Zhu provide a sufficient suggestion to a person of ordinary skill in the art at the time the invention was made to modify Chang's system to include merging the update information edited from the user input to create shared screen update being simultaneously displayed during the live data conference in addition to Chang's merging the modify content information back into the electronic document.

a template edit merging device that merges a modified item template back into the electronic document even if the user edits the content of one or more items managed by the item template in the actively live web page, while the item template is simultaneously being modified or updated by the author (The fact shows that Chang teaches merging first modified content information back into the electronic document even if second content information was altered while the first information was modified (page 7, lines 16-19; and page 14, section 4.6). That is, "pages are not locked during [group] editing" and edits must be resolved by the user only if "an edit to the [same] item has occurred." (Chang, page 14). Thus, the Chang reference provides a sufficient suggestion to those skilled in the art to modify the Chang system to permit merging of modified first information back into the electronic document even if second information was altered while the first information was modified, so long as the first and second information are not the same information.

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Chau Nguyen whose telephone number is (571) 272-4092. The examiner can normally be reached on 8:30 am – 5:30 pm Mon-Fri.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Doug Hutton, can be reached on (571) 272-4137. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306. On July 15, 2005, the Central Facsimile (FAX) Number will change from 703-872-9306 to 571-273-8300.

Art Unit: 2176

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
